A Cadapult Software Solutions Publication

A Practical Guide to AutoCAD® Map 3D 2012

Introduction

Congratulations on choosing this course to help you learn how to use AutoCAD Map 3D 2011. The term “practical” is used in the title because this course focuses on what you need to effectively use AutoCAD Map 3D 2012, and does not complicate your learning experience with unnecessary details of every feature in the product. Should you want to pursue aspects of features and functionality in greater detail than provided in this course, you are directed and guided to that information.

Each lesson contains the concepts and principles of each feature to provide you with the background and foundation of knowledge that you need to complete the lesson. You then work through real world exercises to reinforce your understanding and provide you with practice on common tasks that other professionals are performing with AutoCAD Map 3D 2012 in the workplace every day.

You can take the lessons in this course in whatever order is appropriate for your personal needs. If you want to concentrate on specific features, the lesson for those features does not require that you complete prior lessons. With this course organization, you can customize your own individual approach to learning AutoCAD Map 3D.

When you complete this course, you will be armed with the background and knowledge to apply AutoCAD Map 3D to your job tasks, and become more effective and productive in your job.

Course Objectives

The objectives of this course are performance based. In other words, once you have completed the course, you will be able to perform each objective listed. If you are already familiar with AutoCAD Map 3D, you will be able to analyze your existing workflows, and make changes to improve your performance based on the tools and features that you learn and practice in this course.

After completing this course, you will be able to:

- Work with global coordinate systems in AutoCAD Map 3D.
- Create and edit mapping specific geometry.
- Work with attribute data in the form of Object Data and external database links.
- Apply Object Classification to your mapping system.
- Incorporate aerial photos and raster images into your mapping system.
- Import GIS data from other formats into AutoCAD Map 3D.
- Establish and manage a mapping system that uses high-performance technology to access and work with several formats of GIS data.
- Apply effective and impactful styles to your mapping data.
- Establish and work within a system of related drawing-based maps.
- Create, manage, and analyze topologies.
- Create sophisticated map books.

Prerequisites

Before starting this course, you should have a basic working knowledge of AutoCAD®. A deep understanding of AutoCAD is not required, but you should be able to:

- Pan and Zoom in the AutoCAD drawing screen.
- Describe what layers are in AutoCAD, and change the current layer.
- Create basic CAD geometry, such as lines, polylines and circles.
- Use Object Snaps.
- Describe what blocks are, and how to insert them.
- Perform basic CAD editing functions such as Erase, Copy, and Move.

If you are not familiar with these functions, you can refer to the AutoCAD Help system throughout the course to gain the fundamental skills needed to complete the exercises.

Conventions

The course uses the following icons and formatting to draw your attention to guidelines that increase your effectiveness in AutoCAD Map 3D, or provide deeper insight into a subject.

The magnifying glass indicates that this text provides deeper insights into the subject.

The compass indicates that this text provides guidance that is based on the experience of other users of AutoCAD Map 3D. This guidance is often in the form of how to perform a task more efficiently.

The warning indicates that a specific exercise might not function properly on 64 bit operating systems.

Exercises

The exercises in this course have been carefully chosen and designed to represent common tasks that are performed by mapping and GIS professionals. The data included in the exercises are typical drawings and maps used by local governments and municipalities. You work with road networks, parcel maps, sewer collection systems, water distribution systems, aerial photos, raster surfaces, and much more.

Exercises provide higher level process information throughout the exercise tasks. You are given information about not only what to do, but why you are doing it. In most cases, an image is included to help guide you.

Installing the Datasets

The CD included with this book contains all of the datasets required for the exercises.

There are two ways to install the dataset:

- Use the Setup.exe.
- Unzip the files.

Use Setup.exe

Double click setup.exe and follow the instructions for installation.

Unzip the Files

Unzip AutoCAD Map 3D Training.zip directly to the C drive. The zip file will create the following folder structure:

C:\A Practical Guide\Map 3D 2012\Chapter Number\Files for Exercises

64 Bit Database Drivers

On 64 bit systems, exercises that require a connection to an ODBC database need to have the proper drivers from Microsoft installed. If your system does not have these installed, you can download them from Microsoft. Go to [<http://www.microsoft.com>] and search for Microsoft Access Database Engine.

Table of Contents

Chapter 1	AutoCAD® Map 3D User Interface	1
1.1	Lesson: Navigating the AutoCAD Map 3D User Interface	2
1.1.1	Navigating the AutoCAD Map 3D Interface	9
Chapter 2	Creating Map Geometry	13
2.1	Lesson: Establishing Coordinate Systems in Maps	14
2.1.1	Assigning a Coordinate System	18
2.1.2	Coordinate Tracking	21
2.1.3	Digitizing Points	22
2.2	Lesson: Creating and Inquiring COGO Data	24
2.2.1	Drawing with Transparent Commands	27
2.2.2	Line and Arc Information	29
2.2.3	Angle Information	30
2.2.4	Continuous Distance	30
2.2.5	Continuous Distance from a Base Point	31
2.2.6	Add Distance	31
2.2.7	List Slope	32
2.3	Lesson: Using Drawing Cleanup	33
2.3.1	Break Crossing Objects	37
2.3.2	Extend Undershoots	41
2.3.3	Delete Duplicates	42
2.3.4	Zero Length Objects	44
2.3.5	Dissolve Pseudo Nodes	45
2.3.6	Simplifying Objects	46
Chapter 3	Working with Attribute Data	51
3.1	Lesson: Attribute Data Concepts	52
3.2	Lesson: Defining Object Data Tables	57
3.2.1	Creating Object Data Tables	61
3.3	Lesson: Attaching Object Data to Objects	66
3.3.1	Attaching Object Data to Objects	70
3.3.2	Attaching Object Data While Digitizing	72
3.4	Lesson: Editing Object Data and Object Data Tables	75
3.4.1	Editing Object Data	80
3.4.2	Editing Object Data Tables	82

3.5	Lesson: Attaching External Databases	84
3.5.1	Attaching External Databases.....	87
3.6	Lesson: Working with Data View.....	89
3.6.1	Navigating in the Data View Table	92
3.6.2	Applying SQL Filters.....	93
3.7	Lesson: Defining a Link Template and Generating Links.....	98
3.7.1	Defining a Link Template	104
3.7.2	Attaching Database Data to Existing Objects	105
3.7.3	Attaching Database Data While Digitizing	107
3.7.4	Generating Links to Existing Blocks	109
3.7.5	Highlighting objects by selecting records.....	110
3.7.6	Highlighting table records by selecting objects	112
3.7.7	Using Spatial Filters.....	113
3.8	Lesson: Establishing the Dynamic Annotation Environment.....	114
3.8.1	Defining an Annotation Template	118
3.9	Lesson: Inserting and Managing Dynamic Annotation.....	121
3.9.1	Annotating Objects	124
3.9.2	Annotating Multiple Values	125
3.9.3	Updating Annotation	128
3.9.4	Rotating Annotation to Align with Objects.....	129
3.9.5	Adding Text to Annotation Expressions.....	130
3.9.6	Adding the Inch Symbol ("")	131
3.9.7	Adding Length to the Annotation Template	132
3.9.8	Controlling Precision.....	134
Chapter 4	Object Classification	137
4.1	Lesson: Creating Object Classification Definition Files and Object Classes.....	138
4.1.1	Log in as SuperUser	143
4.1.2	Create a New Definition File	144
4.1.3	Define an Object Class	144
4.2	Lesson: Classifying Existing Objects and Validating Standards.....	149
4.2.1	Classifying Existing Objects.....	153
4.2.2	Validating Classified Objects.....	154
4.3	Lesson: Creating New Classified Objects	155
4.3.1	Creating New Classified Objects.....	157

Chapter 5	Using Raster Images in Maps	159
5.1	Lesson: Inserting Raster Images	160
5.1.1	Inserting a Correlated Image	165
5.2	Lesson: Managing Raster Images	168
5.2.1	Adjust Image Display Properties.....	171
5.2.2	Clipping Images	171
Chapter 6	Importing and Exporting	175
6.1	Lesson: Importing GIS Formats.....	176
6.1.1	Importing an ArcInfo Coverage	179
6.1.2	Importing Polygons from an ArcView Shapefile.....	184
6.1.3	Creating Centroids	190
6.2	Lesson: Exporting GIS Formats.....	193
6.2.1	Exporting Polygons to a SHP file	197
6.2.2	Export to Autodesk SDF	199
Chapter 7	Connecting to Feature Sources	203
7.1	Lesson: Feature Source Concepts	204
7.2	Lesson: Connecting to SDF and SHP.....	208
7.2.1	Connect to and Add SDF Data	212
7.2.2	Connect to and Add SHP Data	215
7.3	Lesson: Working with Feature Layers.....	218
7.3.1	Working with Feature Layers	222
7.4	Lesson: Connecting to Raster and Raster Surfaces.....	224
7.4.1	Connecting to an Aerial Photo	229
7.4.2	Connecting to a Raster Surface.....	231
7.5	Lesson: Connecting to ODBC Point Feature Sources.....	233
7.5.1	Create a System DSN	236
7.5.2	Connect to a DSN, and Add Points to a Map	238
7.6	Lesson: Working with Survey Data Stores.....	241
7.6.1	Working with Survey Data	246
Chapter 8	Stylizing Features.....	249
8.1	Lesson: Stylizing Lines, Points, and Polygons	250
8.1.1	Stylizing Polygon Features	255
8.1.2	Stylizing Line Features	259
8.1.3	Stylizing and Labeling Point Features.....	260

8.2 Lesson: Stylizing Raster Surfaces	263
8.2.1 Stylizing Raster Features.....	268
8.2.2 Creating Contours from a Raster Surface	270
8.3 Lesson: Creating Scale Dependent Styles.....	271
8.3.1 Working with Scale Dependent Styles.....	275
8.4 Lesson: Applying Themes to Feature Layers	278
8.4.1 Thematic Mapping of Linear Objects with Object Data	282
8.4.2 Thematic Mapping of Polygon Features	286
Chapter 9 Working with Features.....	289
9.1 Lesson: Creating Feature Filters and Feature Queries.....	290
9.1.1 Performing a Filter to Select.....	294
9.1.2 Performing a Feature Query	295
9.2 Lesson: Editing Feature Geometry and Attributes	297
9.2.1 Editing Features	302
9.3 Lesson: Creating Joins	306
9.3.1 Create a System DSN	311
9.3.2 Join Tables, and Create a Thematic Map.....	313
9.4 Lesson: Using Constraints.....	317
9.4.1 Working with Constraints	321
9.5 Lesson: Bulk Copy Between Feature Sources	324
9.5.1 Exporting an SHP to an SDF	328
9.5.2 Bulk Copy from an SDF to an SHP	329
Chapter 10 Using Attached Source Drawings.....	333
10.1 Lesson: Managing Source Drawings.....	334
10.1.1 Managing Source Drawings.....	340
Chapter 11 Source Drawing Queries	345
11.1 Lesson: Executing Location and Property Queries.....	346
11.1.1 Executing Location Queries	353
11.1.2 Executing Property Queries	359
11.1.3 Executing Compound Queries	361
11.2 Lesson: Executing Data Queries.....	365
11.2.1 Query by Pipe Size from Object Data.....	369
11.3 Lesson: Altering Properties During Queries	373
11.3.1 Execute a Query with a Property Alteration.....	376
11.4 Lesson: Using Save-Back.....	378
11.4.1 Execute Save-Back to Save Changes to an Attached Source Drawing.....	384

11.5 Lesson: Working with Multiple Coordinate Systems.....	387
11.5.1 Working with Source Drawings in Multiple Coordinate Systems	390
Chapter 12 Working with Topologies	393
12.1 Lesson: Creating Network Topologies	394
12.1.1 Creating a Network Topology	399
12.2 Lesson: Creating Polygon Topologies	403
12.2.1 Creating a Polygon Topology.....	408
12.3 Lesson: Performing Topology Analysis.....	413
12.3.1 Network Analysis.....	417
12.3.2 Performing a Buffer Analysis	419
12.3.3 Performing an Overlay Analysis.....	422
Chapter 13 Map Output	427
13.1 Lesson: Creating Map Books	428
13.1.1 Creating a Map Book.....	432
13.1.2 Navigating Through the Map Book.....	435
13.1.3 Publishing the Map Book.....	436

7 - Connecting to Feature Sources

Lesson: Feature Source Concepts

In this lesson, you learn the concepts of what feature data is, and how it can be integrated into your mapping system.

Lesson: Connecting to SDF and SHP

In this lesson, you learn the basic concepts of the feature source connection, what feature layers are, what attribute data is, and how the connection works with coordinate systems.

Lesson: Working with Feature Layers

In this lesson you learn the basic tools that are used to manage feature layers. Once feature sources are connected to a map, you can manage those layers with draw order, setting the selectivity of the objects on each feature layer, and work with the attributes that are integrated in the features.

Lesson: Connecting to Raster and Raster Surfaces

In this lesson, you learn some of the tools that are used to connect to a raster image, and connect to a raster image. You then learn the basic concepts of raster surfaces, the types of files that you can access, and how raster surfaces can be used as part of your mapping system.

Lesson: Connecting to ODBC Point Feature Sources

In this lesson you learn the process of how to create a Windows System Data Source Name (DSN), connect to the ODBC data source, and add points to a map using values that are part of the data source.

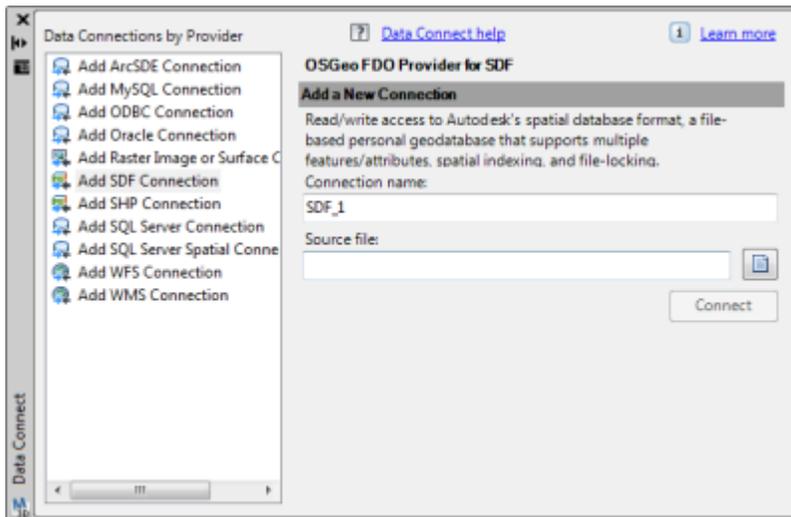

Lesson: Working with Survey Data Stores

In this lesson, you create a new survey data store, import ASCII points, and create new points using COGO tools.

7.1 Lesson: Feature Source Concepts

Introduction

Working with feature sources in AutoCAD Map 3D is a completely different way of working with GIS data than working with CAD objects. In many ways, AutoCAD Map 3D can be regarded as two separate products depending on the type of data you work with, or a single product that enables integration of CAD and GIS data. In this lesson, you learn the concepts of what feature data is, and how it can be integrated into your mapping system.

Key Concepts

Concepts and key terms covered in this lesson are:

- Data Store
- Features
- Data Connections

Objectives

After completing this lesson, you will be able to:

- Describe feature source data.
- List the standard data types that are available through FDO connect.
- Explain the basic tools that can be used to work with features.

Introduction to Feature Sources

AutoCAD Map 3D was originally developed to provide mapping and basic GIS functionality within a CAD environment. This functionality is limiting for a few reasons; GIS datasets are generally very large in size and the processing overhead in a CAD environment makes working with this data cumbersome. In addition, integrating attributes from external databases and even internal data such as Object Data can be challenging from a management standpoint when compared to typical GIS applications.

While there are limitations when working with CAD data to produce GIS functions, this aspect of AutoCAD Map 3D is still a very powerful way to integrate GIS functions in a CAD environment, and stands as the best application on the market to integrate this functionality. Using AutoCAD Map 3D to work with CAD objects for GIS functions remains as the overwhelming application of the product by users worldwide when compared to working with feature sources.

When feature sources were introduced to AutoCAD Map 3D in release 2007, it opened the door to an almost endless supply of GIS data. The Feature Data Objects (FDO) technology that is used to access and manipulate GIS data is an open source technology. Since the initial introduction of FDO on the market, dozens of companies have developed data providers that have enabled even more data formats to be accessible to AutoCAD Map 3D. In many cases, these data providers are available free of charge.

There is no reason to work with only CAD or only GIS data. In fact, one of the powerful aspects of having FDO technology integrated in AutoCAD Map 3D is that you can work with both formats in a single environment. Finding a way of integrating engineering and GIS disciplines has been sought for many years. AutoCAD Map 3D provides this ability, for the first time, in a significant and robust application.

Features and Objects

There are two terms that are used when working with data in AutoCAD Map 3D:

- Objects
- Features

Objects

Objects refer to CAD entities in a drawing. Along with the objects themselves, are the tools that you use to manipulate and manage them. For example, you use layers to organize objects, attribute data in the form of external databases and Object Data, and the same tools as AutoCAD to edit objects.

Features

Feature is the term used when referring to map elements that are connected as a feature source. The tools to manipulate features are a completely different set of tools than those that are used to work with CAD objects. For example, features are organized on feature layers rather than standard layers that are used for objects.

The following are some examples of how features and objects differ.

Objects	Features
Objects are opened and loaded into memory when a drawing is opened.	Features are accessed as a Data Source connection, and are cached.
Objects reside on AutoCAD layers.	Features are assigned to a feature layer, based on a feature class.
Object attribute data resides as block attributes, Object Data, or external database links.	Attribute data is integrated into the feature source.
Drawings with objects have a practical ceiling of performance when working with a large number of objects.	Feature sources have a level of performance that is several factors higher than that of objects.
When working with multiple drawings, they are managed as attached source drawings.	Multiple data stores are connected to a drawing.
After you finish editing drawing objects, you save the drawing.	When editing features, you check them out of the data store, and when the editing is complete, you check the features back into the data store.

The main point to be made about these comparisons is that there is an entirely different set of tools used to work with feature sources, many of which perform the same tasks as when working with CAD, except that they are used on features. Understanding these differences is important to learning how to work with features, and more importantly, to be able to decide which type of data you work with based on the tools, data, and performance you need to do your job.

Importing GIS Formats and Native Access

Importing and exporting GIS data into and out of the CAD format is still available in AutoCAD Map 3D, and in some cases, this may still be a valid way to work with GIS data depending on what the final purpose of that data is. For example, if you intend to work with the data from that point forward exclusively in a CAD environment, then importing the data is the most appropriate approach.

Round tripping data, the process of importing, editing, and then exporting back to the original format was a very challenging exercise because it was difficult to maintain the full integrity of the GIS format when it was returned to the original format. With the presence of FDO technology, you no longer import GIS data, but rather you work with it directly in its native format. Importing and exporting for the purpose of editing other GIS formats is a legacy process, and should be abandoned in nearly every case.

Feature Source Formats

AutoCAD Map 3D ships with several data providers that enable you to access some of the most popular GIS data formats immediately. There are two main types of formats you can access.

- Relational Data Base Management Systems (RDBMS)
- File based formats

Relational Data Base Management Systems

Most large GIS installations store and manage their data in an RDBMS. There are several advantages to this functionality:

- A central repository of data sometimes referred to as a “single truth.”
- A nearly unlimited amount of data storage and management.
- Vectors and attributes can be stored.
- Integration with other office systems such as SAP.
- Multiple client applications can access the data.

The RDBMS data providers included with AutoCAD Map 3D are:

- ArcSDE
- MySQL
- Oracle
- SQL Server
- SQL Server Spatial

File Based Formats

An advantage of using file based formats is ease of use. Unless your GIS installation is large, or is outgrowing capacity, file based formats may be the best choice. One disadvantage of using file based formats is that depending on the file type, these data stores are locked from other users when they are connected to a drawing, and the drawing is open.

The file based formats included in AutoCAD Map 3D are:

- Raster formats; DEM, TIFF, JPEG, ECW, PNG, MrSID, ESRI ASCII, DTED
- SDF
- SHP
- WFS
- WMS
- ODBC connections

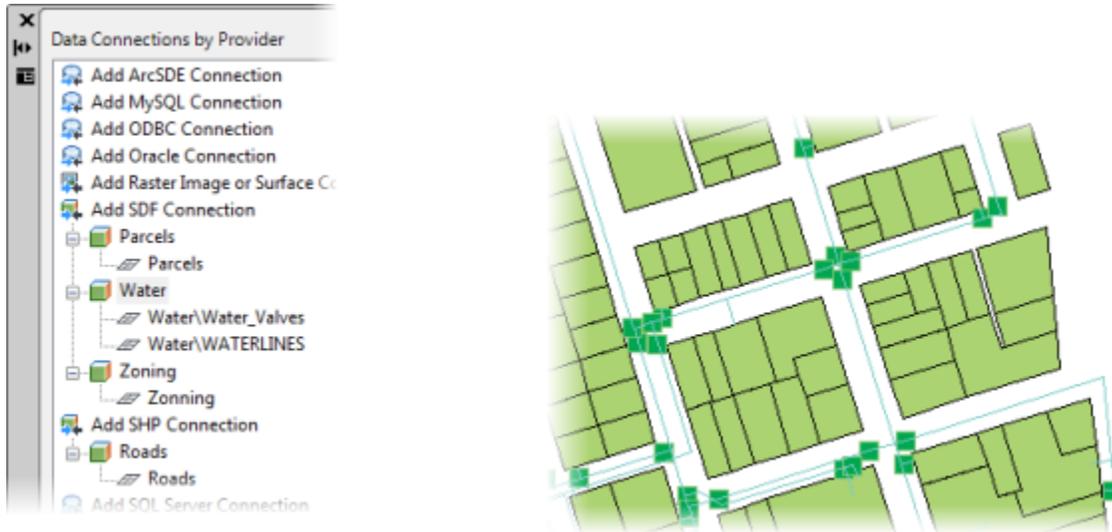

To find out more about FDO Open Source technology and additional data providers, visit OSGEO www.osgeo.org.

7.2 Lesson: Connecting to SDF and SHP

Introduction

Connecting to a feature source and adding the data to your map is the first step in integrating native GIS formats into your mapping system. In this lesson, you learn the basic concepts of the feature source connection, what feature layers are, what attribute data is, and how the connection works with coordinate systems. You then connect to two file-based GIS formats and review the data in AutoCAD® Map 3D.

Key Terms

Concepts and key terms covered in this lesson are:

- Connecting to feature sources
- Adding data to maps
- Feature classes
- Coordinate systems
- Feature layers

Objectives

After completing this lesson, you will be able to:

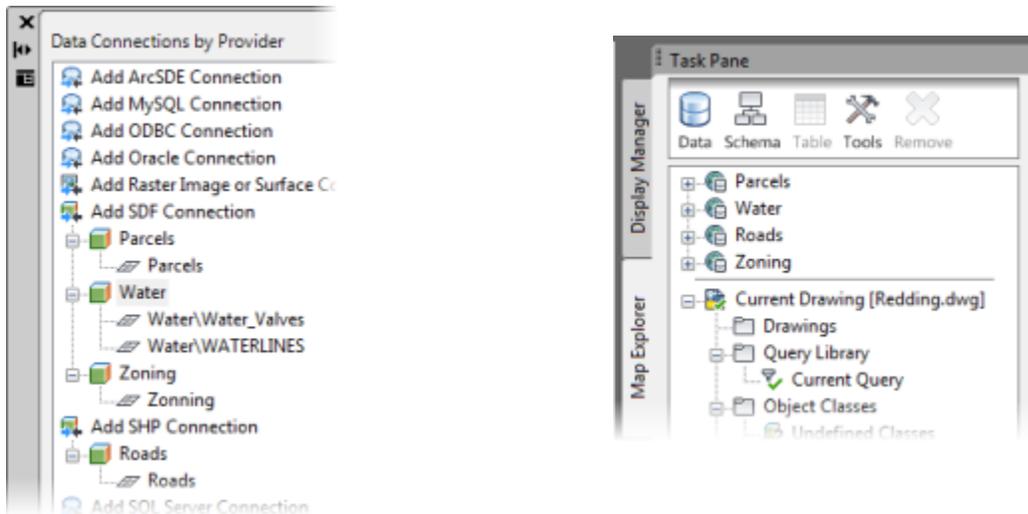

- Describe what a feature source connection is.
- Explain what it means to add data to a map.
- Explain how coordinate systems are applied.
- Describe what a feature layer is.
- Connect to an Autodesk SDF file and add data to a map.
- Connect to an ArcView SHP file and add data to a map.

Feature Source Connection Concepts

When working with feature sources, at no point is any of the data actually inserted or added to the drawing. Instead, you connect to the data through the Feature Data Objects (FDO) technology. Once feature sources are connected to a drawing, and the drawing is saved, the connections are also saved and the next time the drawing is opened, they automatically reconnect.

You can connect to data without adding the geometry to the map. This approach enables attributes of connected feature sources to be joined or accessed without displaying, and many times without requiring that the data is represented graphically on the map.

Feature source connections can be seen in the Data Connect palette. They are also displayed in the Map Task Pane in the Map Explorer tab.

Connecting to a feature source does not automatically add the geometry to the map. Connecting to and adding geometry to a map are two separate procedures.

Adding Data to Maps

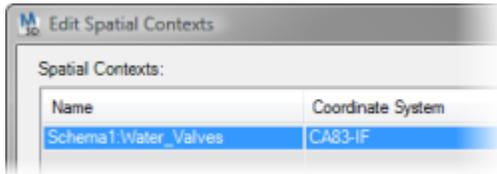

Once a connection has been established to a feature source, there are several options as to how the data in that feature source is added to the map.

Some of these options are:

- Edit coordinate system
- Add to map with a query
- Single feature classes

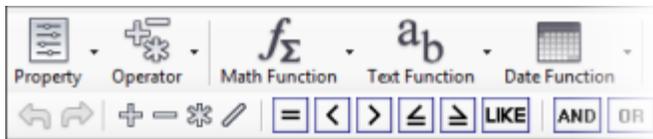

Edit Coordinate System

You can assign a different coordinate system to a feature class while adding geometry to the map.

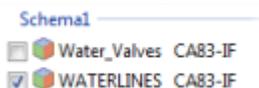

Add to Map with a Query

In some cases, the data that is connected to is too large in size or geographic area to reasonably add to a map. This is especially true when accessing data that resides in an RDBMS such as Oracle®. In these cases, you can create a query while adding the data to the map which limits the amount of data that is added.

Single Feature Class

Some feature sources such as the Autodesk SDF file, support multiple feature classes. Depending on how the data is organized in a mapping system, this data might include several feature classes. You can select only the classes that you want to add to the map, or select all of the feature classes that are available in the feature source.

How Coordinate Systems Work in Feature Classes

Many of the standard feature sources which you can connect to, have coordinate system assignments integrated into the feature source itself. In this case, AutoCAD Map 3D reads that coordinate system as part of the connection and uses it to convert to the current drawing coordinates when the data is added to the map.

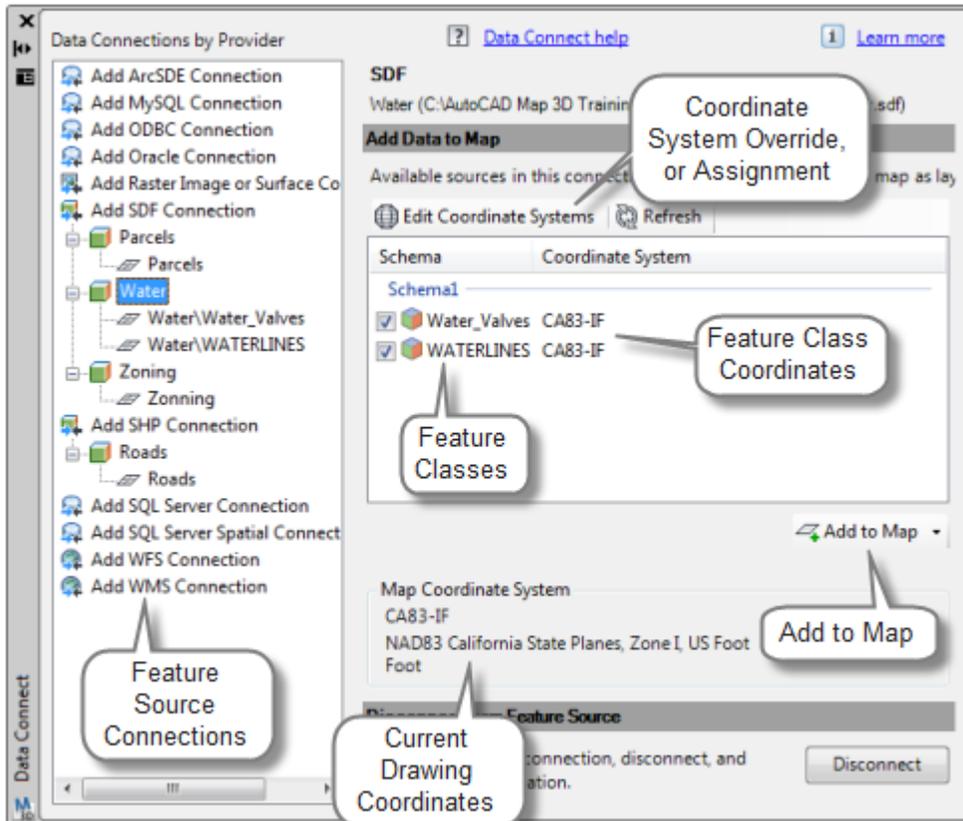

If a feature source either does not have a coordinate system assigned, or does not support a coordinate system assignment, you can assign a coordinate system as part of the process of adding the data to the map. You can also override existing coordinate systems, although this is an uncommon practice.

If a feature class with a coordinate system assignment is added to a current drawing that does not have a coordinate system assigned, the current drawing automatically adopts the feature class coordinate system. This is true only for the first feature class that is added to the map. Once the coordinate system is adopted in the current drawing, all subsequent feature classes that are added to the map use the coordinate system that had been assigned by the first feature class added.

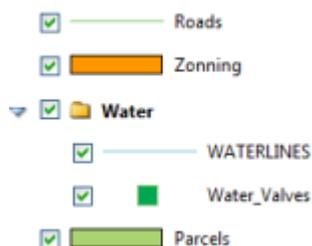

Assigning a coordinate system while adding data to a map, does not save the coordinate system back to the feature source.

Connection and Add to Map Interface

Feature Layer Concepts

When adding feature classes to a map, each feature class is treated as a feature layer. The feature layers are displayed in the Map Task Pane in the Display Manager tab.

Styles are not saved in feature sources or feature classes. When a feature class is added to a map, AutoCAD Map 3D assigns a temporary style to the feature layer.

Exercises: Connect to and Add Feature Data to a Map

In these exercises, you connect to three SDF files and use various options while adding data to the map. You first connect to and add Parcels to the map using default values while adding the data to the map. You then connect to an SDF, which contains two feature classes, and add both of those feature classes to the map. Finally, you connect to and add district polygons to the map, while assigning a coordinate system, and creating a query to add only the zones that immediately surround the parcels.

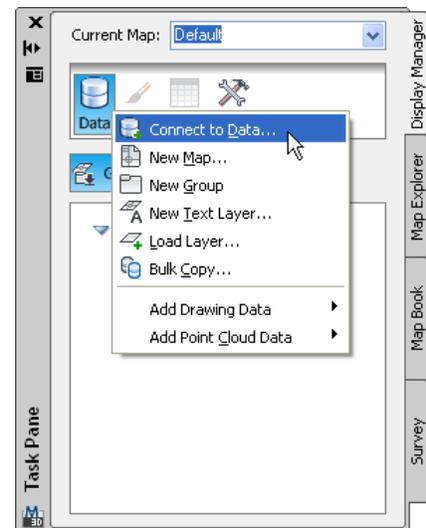

You do the following:

- Connect to an SDF file.
- Add the parcels to the map.
- Connect to and add an SDF file with multiple feature classes.
- Use a spatial filter to limit the features added to the map.

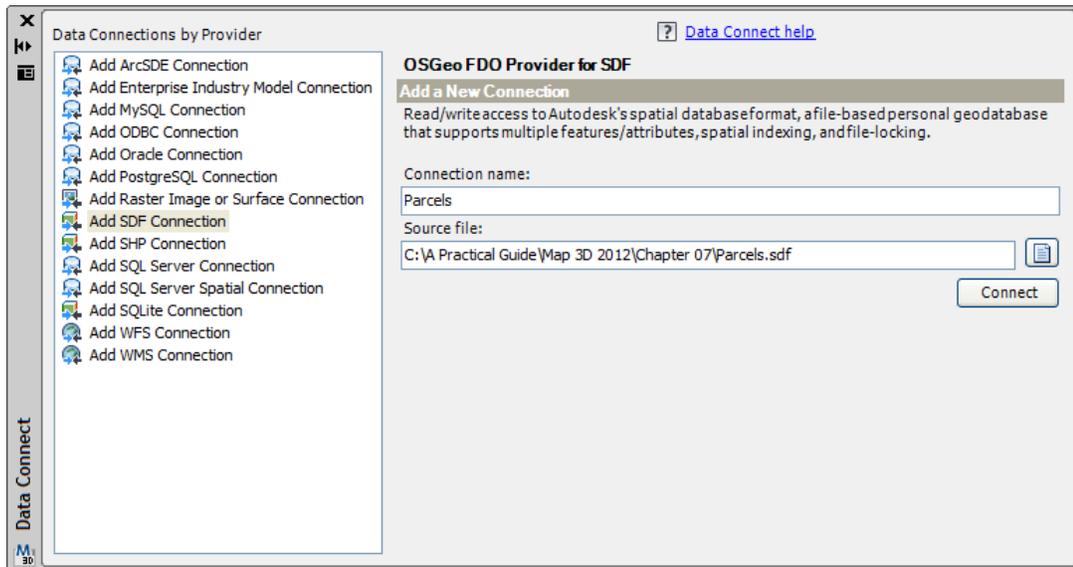

7.2.1 Connect to and Add SDF Data

In this exercise you will learn to create a connection to an SDF file and display it as features in the drawing through the Display Manger.

1. Press **Ctrl + N** and select the default template **map2d.dwt** to start a new, blank drawing.
2. On the *Task Pane*, select the **Display Manager** tab.
3. Confirm that the **Groups** button is selected.
4. In the **Display Manager**, click the **Data** button, and then select **⇒ Connect to Data...** .

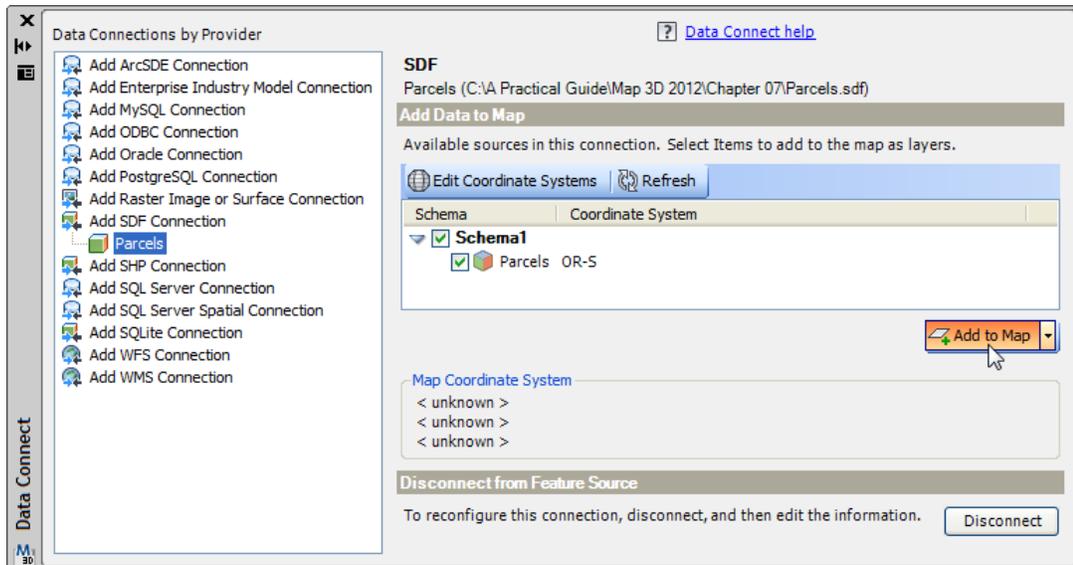

The *Data Connect* palette opens. Here you can select from many different data providers or sources. In this exercise you will be connecting to an SDF file. However, there are many additional data providers available that allow you to connect to almost any standard GIS data source.

5. From the *Data Connections by Provider* list, select **Add SDF Connection**.
6. Change the *Connection name*: to **Parcels**.
7. Click the file button  and browse to: **C:\A Practical Guide\Map 3D 2012\Chapter 07**, and select **Parcels.sdf**.
8. Click **<<Connect>>**.

The SDF file *Parcels* appears in the *Default Schema* list. Notice the coordinate system is *OR-S* (Oregon State Planes, South Zone, US Foot). *AutoCAD Map 3D* reads this from the SDF file. Since the *Map Coordinate System* is set to *unknown* (or not set at all) the coordinate system of the SDF file will automatically be assigned to the Map and no conversion will occur.

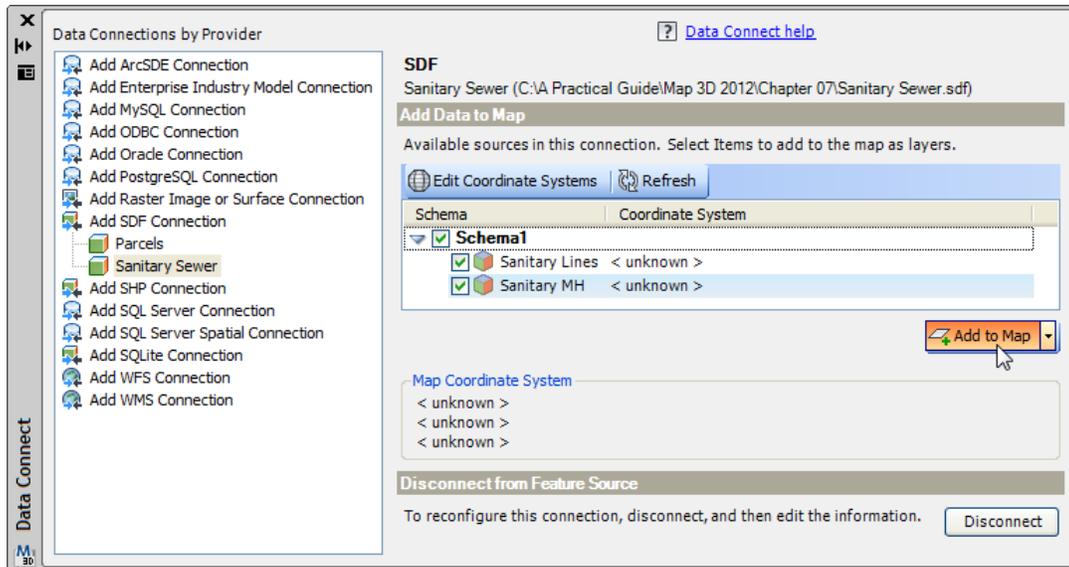

9. Click **<<Add to Map>>**.

Notice the *data* layer *Parcels* now appears in the *Display Manager*. A layer in the *Display Manager* is different than an *AutoCAD* layer; it is the name of a data source and where you manage its properties.

AutoCAD Map 3D randomly assigns a color to the objects, and cycles through a variety of colors when you attach to multiple data sources, to help you distinguish them.

10. Next you will connect to an SDF file that contains both Sanitary Sewer Lines and Manholes. Repeat Steps 5-9 using the following information:

- For the *Connection Name* enter **Sanitary Sewer**
- Connect to the file **Sanitary Sewer.sdf** in the **Chapter 07** folder

11. Click the **Schema1** checkbox to activate the *Sanitary Lines* and *Sanitary MH* schemas.

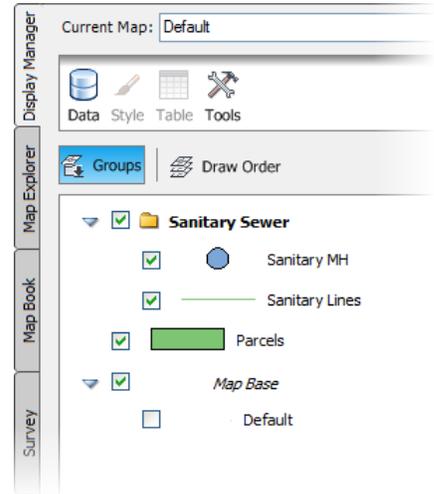

Notice there is no coordinate system contained in this SDF file; it is labeled as "unknown". Since you did not assign a coordinate system to this file no coordinate conversion will occur. That is fine for this exercise, as the data in this SDF file was created in the correct coordinate system and a conversion is not needed.

12. Click <<**Add to Map**>>.

The Sanitary Sewer Lines and Manholes are added to the drawing. Random styles are automatically applied to the objects.

- In the *Display Manager*, confirm there are now three feature layers.

Notice the *Sanitary Sewer* lines and *Manholes* are nested under the *Sanitary Sewer* connection.

- Save the drawing in the **Chapter 07** folder as **City Infrastructure.dwg** for use in the next exercise.

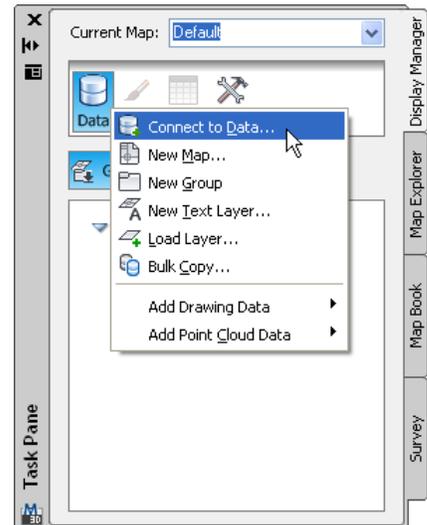

7.2.2 Connect to and Add SHP Data

In this exercise you connect to and add SHP data to the existing map. One of the important aspects of this exercise is that the process for connecting to and adding data to a map is exactly the same as adding SDF data. The procedure remains the same, regardless of the data type.

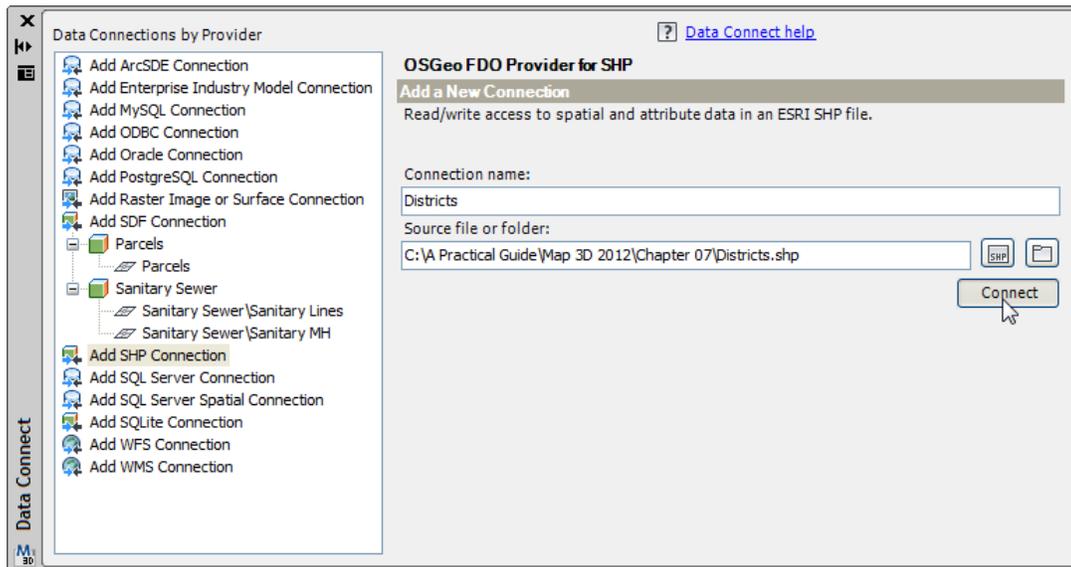

- Continue working in the drawing **City Infrastructure.dwg** that you created in the last exercise.

If you did not complete the previous exercise you can open the drawing **Connect to SHP.dwg**.

- In the *Display Manager*, confirm that the **Groups** button is selected.
- In the **Display Manager**, click the **Data** button, and then select ⇒ **Connect to Data...**

The *Data Connect* palette opens. Here you can select from many different data providers or sources. In this exercise you will be connecting to a Shapefile. However, there are many additional data providers available that allow you to connect to almost any standard GIS data source.

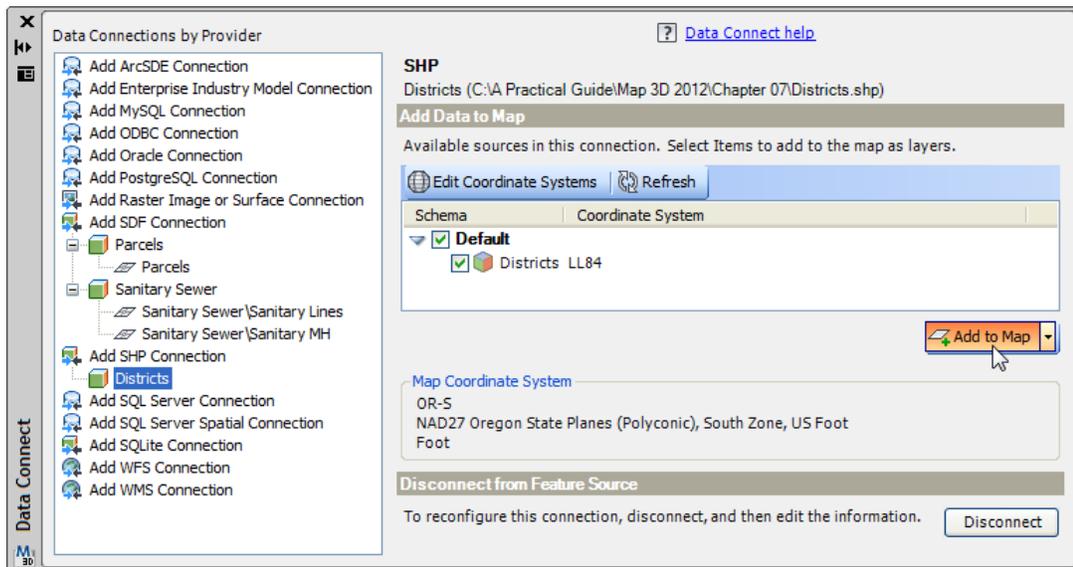

4. From the *Data Connections by Provider* list, select **Add SHP Connection**.
5. Change the *Connection name*: to **Districts**.

The Shapefile to which you are connecting represents geographical districts. The connection name is just a label for this new data source. Adding descriptive labels helps you manage multiple connections.

6. Click the SHP button .
7. Browse to: **C:\A Practical Guide\Map 3D 2012\Chapter 07**, and select **Districts.shp**.
8. Click **<<Connect>>**.

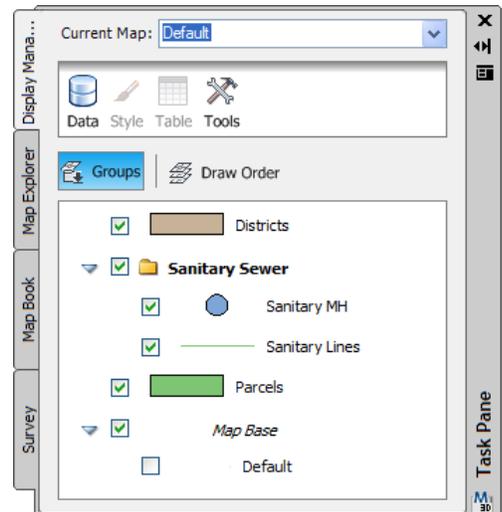

The shapefile *Districts* appears in the *Default Schema* list. Notice the coordinate system is *LL84* (Lat Longs, WGS 1984). *AutoCAD Map 3D* reads this from the shapefile *Project File* (.prj). As the data is added to the map it will be converted from the coordinate system of the Shapefile (LL84) to the coordinate system of the Map (OR-S). This does not edit the original Shapefile in any way it only converts for display in the map.

9. Click <<Add to Map>>.
10. Close the *Data Connect* palette.

Notice the *data* layer *Districts* now appears in the *Display Manager*. A layer in the *Display Manager* is different than an *AutoCAD* layer; it is the name of a data source and where you manage its properties.

AutoCAD Map 3D randomly assigns a color to the objects, and cycles through a variety of colors when you attach to multiple data sources, to help you distinguish them. In the next exercise, you will explore some display options, including assigning a color to the newly connected data.

11. Save the drawing for use in the next exercise.

Lesson Review

In this lesson you began the process of establishing an environment in *AutoCAD Map 3D* that uses other GIS formats in their native files. This process is an important departure from using only *AutoCAD* based objects in your mapping system.
